

Feedback from my coaches

Student: David Eslava

Challenge: Challenge 1, The Witness

These are my own notes, written after each meeting. What I did with every piece of feedback is in my LO4 Personal Leadership document.

Faruk told me that my analysis is already quite good. We talked about the problem I had with finding suitable sprites for my game. He said that I could include this problem and the solution in my analysis, but it is not necessary to change it now. I can apply this to my next project.

The main problem was finding real top-down sprites. AI was not very useful for generating the type of sprites I needed. I decided to try a different approach and found Mixamo, where I could download different characters and animations. I downloaded a mannequin with walking, running and slow walking animations. I then changed the style using nodes and placed the camera directly above the character to create a real top-down perspective, similar to Ape Out. The animation was 19 seconds long, so I took approximately every fourth frame to create PNG frames that I can use as sprites in the game.

For my next steps, I will set time limits for each section so that perfectionism does not make me spend too much time on one task. I will also stay in contact with both of my coaches and contact them proactively every week. I will also check Student+ to find more specific support for ADHD.

Faruk will check my progress and ask me about it every week to help me stay on track.

- **The Witness - Analysis 0.1 document:** Structure the analysis for a fictional client or company. Include the intended client on the cover page and focus on the project challenge, requirements, and proposed solution. Remove personal learning objectives from the client-facing analysis.
- **Tools:** Document the selected tools and technical choices in the Design phase.
- **Project plan:** Create a separate Project Plan, preferably using a Gantt chart. Define specific activities, estimated durations, and dependencies. Ensure the plan fits within the four-week project timeline.
- **Flowchart:** Keep the main flowchart at a high level. Create separate detailed flowcharts only for complex game systems or mechanics.
- **MoSCoW table:** Review the table from the perspective of a reader unfamiliar with the project. Add brief explanations for unclear features or technical terms, such as the sprint mechanic.
- **Implementation priority:** Begin development of the core mechanics immediately. Use basic placeholders for characters and enemies until the gameplay prototype is functional.
- **Character and sprite solution:** Continue evaluating the Blender and Mixamo workflow for creating top-down sprites for the player and The Hunter. Use this approach only if it does not delay core implementation.

Next Steps

1. Create the separate project plan with activities, estimated hours, and dependencies.
2. Revise the analysis to reflect a fictional client and remove personal learning objectives.
3. Move tool and technical-choice descriptions to the Design phase.
4. Review and clarify the MoSCoW table.
5. Maintain the high-level flowchart and add detailed diagrams only where required.
6. Start implementing the core gameplay using placeholder assets.
7. Test the Blender/Mixamo sprite workflow without delaying the prototype.

As a I can (so that In the MosCoW. I have to do a Process Report Document Orientation Doc - I have to put all the workshops I attended no to deep, just explaining in a short way.

18 September 2026, Faruk

The game has to be at least playable — right now I only have one character, no map, no enemies... Without a playable game I can't get validation, and without validation I won't have all the documentation I need.

After looking at my character's script, my coach helped me identify and understand a bit better why it wasn't working and how to fix it. He also suggested using Switch Cases in Godot — called "match", to make my code cleaner, with fewer lines and fewer chances of bugs.
